Running an application:

1. Switch to the z/OS Projects perspective.

2. Define a launch configuration that includes specific environment variables or input parameters for the executable file.
    a. On the workbench toolbar, click the **Run** icon and select **Run**.

    b. In the configurations list, click **Compiled Application**, then click the **New launch configuration** icon.

    c. In the **Name** field, type a name for the launch configuration. This name is added to a list of options under a **Run With Configuration** menu. Choose a name that you can associate with the program, input parameters, and environment variable values that are defined in the launch configuration

      ○ On the **Main** tab, define the `Project`, `Program name`, and `Program` parameters in the respective fields.

      ○ On the **System Environment** tab, specify values for environment variables that the executable file queries at run time.

- On the **Common** tab, define the type of launch configuration and the perspective you want to use for each launch mode.

3. Click **Apply** and **Close**.

4. Run the program.
   . In the Projects view, find the executable file that you want to run.

   a. Right-click the executable file and select **Run With Configuration** > **(launch configuration name you defined previously)**.
